**discrepant**: a point of two persons

**concordant**: a point of two persons  
if a has a higher income than b and  
a is more satisfied than b.

$$\tau_{\text{dg}} = 0.088 \text{ weak positive relationship}$$

$$n = 901$$

6000 - 15000	22
15000 - 25000	13
> 25000	7

Kendall's tau -  $\tau$

$$\tau_{\text{K}} = \frac{C - D}{C + D}$$

$$\in [C - \lambda_i + \lambda_j]$$

$$C = \# \text{ concordant pairs} = 109520$$

$$D = \# \text{ discordant pairs} = 94915$$

$$C = \# \text{ concordant pairs} = 109520$$

$\lambda_i$  less satisfied than  $\lambda_j$ .

$\lambda_i$  and  $\lambda_j$  are called a discordant pair,  
if  $\lambda_i$  has a higher income than  $\lambda_j$  but  
 $\lambda_i$  is less satisfied than  $\lambda_j$ .

$$\gamma_{\text{LR}} = 0.088$$

weak relation ship that people with low income are dissatisfied and people with high income are satisfied.

#### 4.4 Gamma Coefficient

$$\gamma = \frac{C-D}{C+D} = E[C-\lambda_i + \lambda_j]$$

A  $\gamma$  is more sensitive than  $\pi$ !  
dichotomous, ordinal scales

## Example: Ein Zornum-Jörgen-Müller.

Sev

$$\gamma^*(\text{income} - \text{class}, \text{degree of satisfaction}) = 0.127$$

SPSS - command 4.7

positive weak relationship between income and level satisfaction

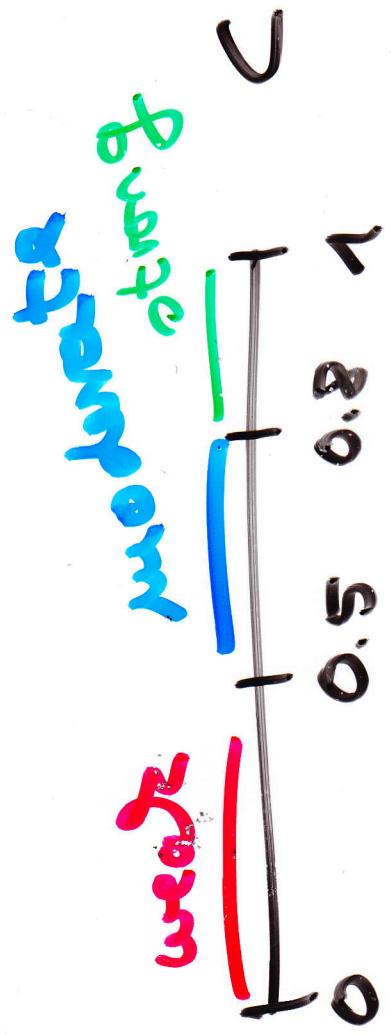

4.5 Coefficient of contingency

relationship ship

$$C(\text{income}, \text{satisfaction}) = 0.125 \text{ weak}$$
